

Your Eyes in the Storm (and Everywhere Else).

The new Valley[®] Weather Station is an important agronomic tool, not only for detecting current and historical weather conditions, but also for assisting with other aspects of the farm, like soil moisture management and irrigation scheduling.

Comes Standard with:

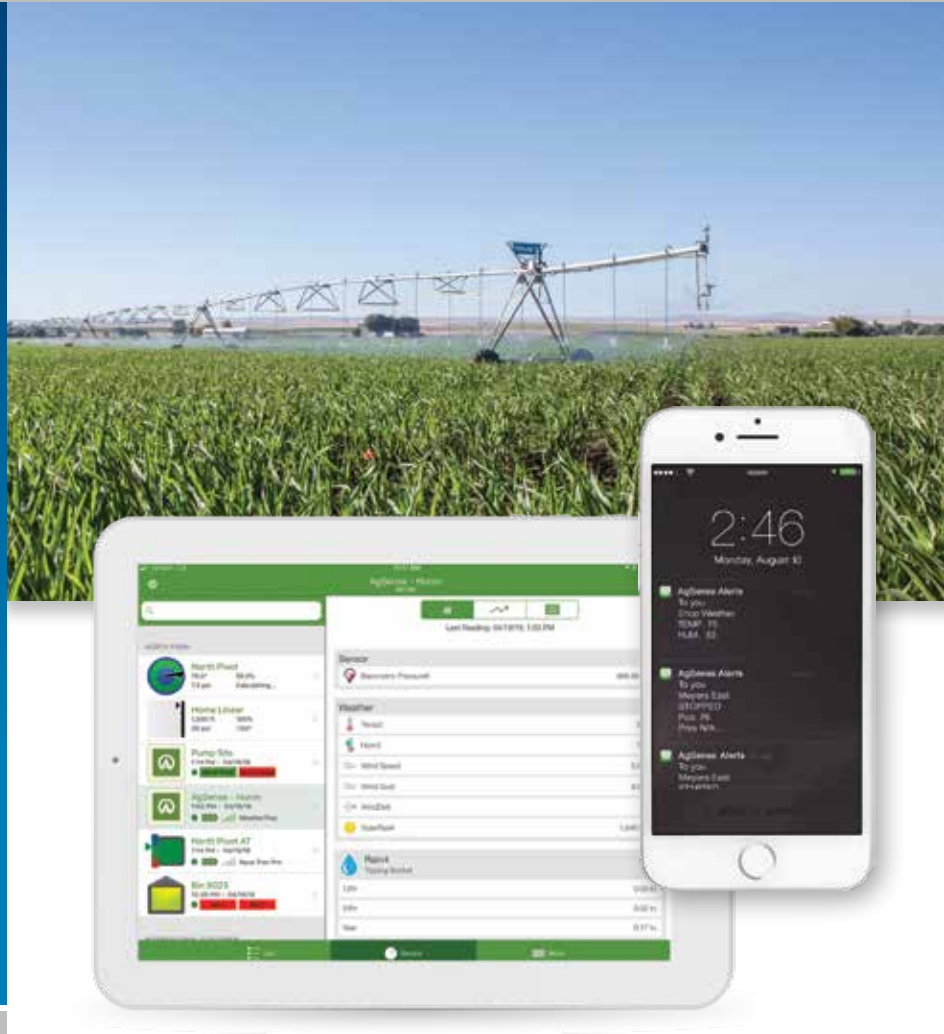

- Valley telemetry to view weather data anytime, anywhere via the web or mobil apps from AgSense[®], a Valley brand
- Integrated sensors and enclosure with a built-in solar panel enclosure with a built-in solar panel
- Sensors for wind direction, wind speed, temperature, humidity, rain, barometric pressure and solar radiation
- Mounting hardware to mount on a tripod, pole or t-post (tripod/pole/t-post not included)

In addition to the standard weather inputs, the Valley Weather Station can read:

- A second rain bucket or an ET gauge (choose one)
- A second temperature sensor (e.g., indoor temperature, outdoor temperature, soil temperature, etc.)
- A flowmeter

Weather Station benefits include:

- Easy installation – a simplified wiring process makes for a quick setup time.
- Quick access – weather data is displayed alongside your irrigation, soil moisture and grain bin data, all on the same dashboard.
- More productivity – real-time text message alerts about changing weather conditions can improve your labor and farm machine efficiency, allowing you to allocate resources where they're needed most.
- Informed decisions – having easy access to real-time heat, humidity and frost conditions will result in better decision making during harvest and when working with livestock.
- Increased accuracy – wind data keeps expensive chemicals where you need them when spraying crops.
- Field-specific data – receive information directly from your field.
- Peace of mind – sleep easier, save trips to the field and use water more efficiently by receiving alerts about changing weather conditions.
